

"After initially qualifying as an engineer and wanting to move into project management, I decided to enroll on the Specialist Master's Degree in Management Control, Risk Management, and Planning, at Reims Management School. I chose this course for its good balance between theoretical teaching and input from professionals, as well as for its multi-disciplinary aspect, which enabled me to learn about planning and cost-control tools that are essential to running a business. Moreover, this sandwich program is strongly oriented towards the world of work (with a company-based time of about 75%), so I was able to go on a 12-month placement with Areva within the project team in charge of dismantling a nuclear power plant. This enabled me to build up a significant initial level of experience in the field of project management."
